

Test Data:

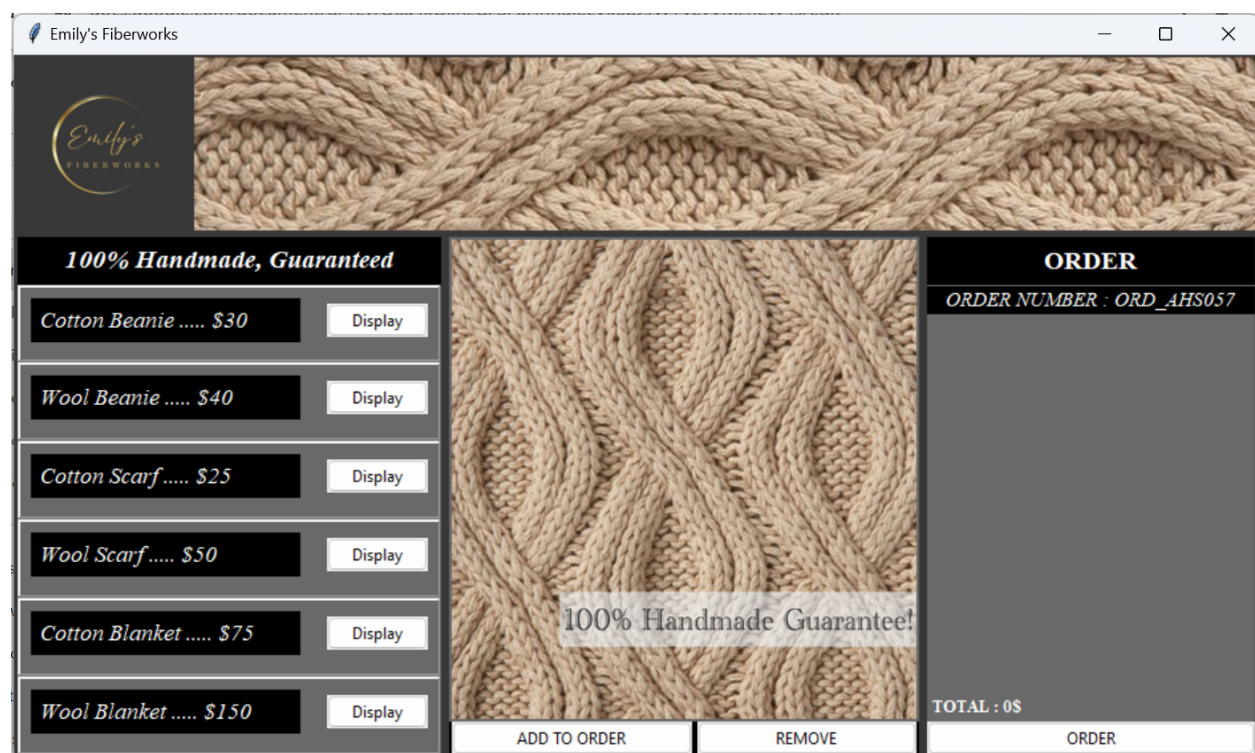

- Hypothetical user wants to order one crochet cotton beanie (my most popular item).
 - User clicks “display”.
 - Photo of a cotton beanie appears, with text describing it above.
 - User clicks “add to order”
 - User clicks “order”
 - This button is meant to generate a receipt. If this app were to be used in real life, a receipt would be generated and printed. However, because this is a hypothetical, no orders were made, and no receipts were printed.

Test Results:

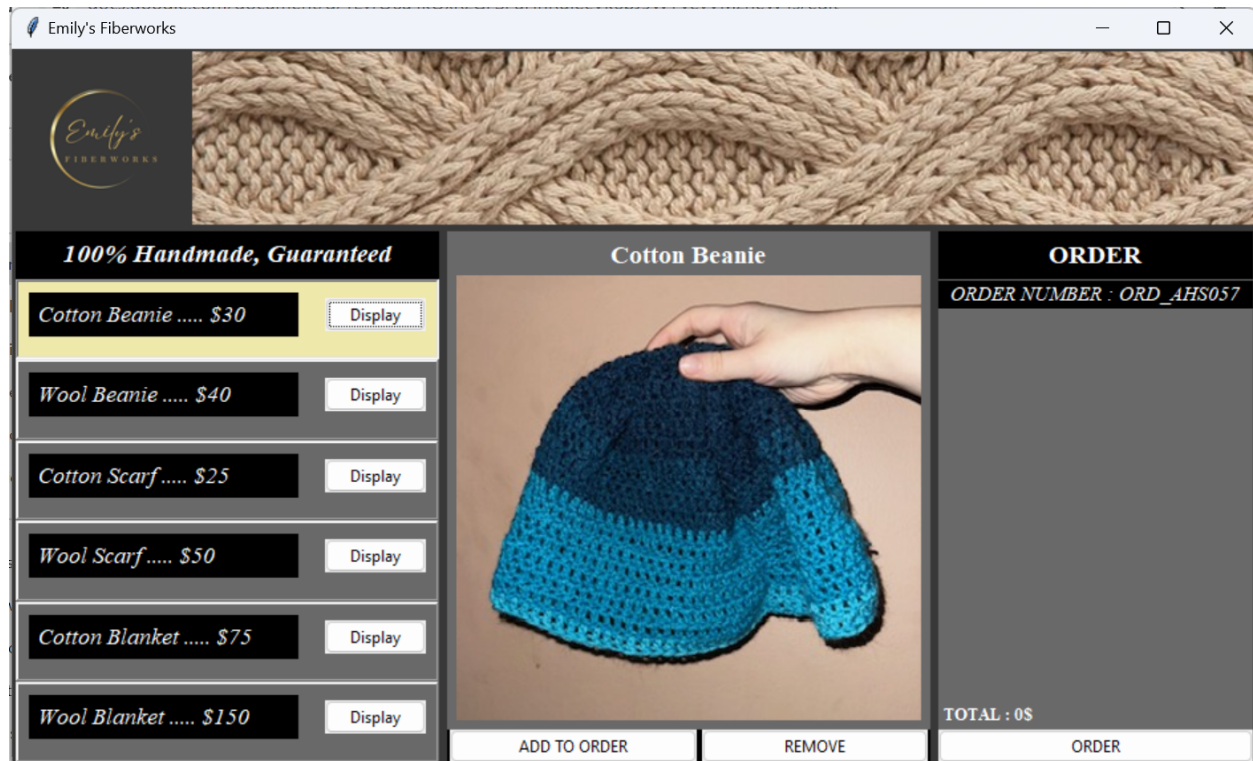

- I eventually realized that if the user wanted to remove an item from their order, they would have to contact me separately, because the remove button is broken. I have looked through my code and nothing appears to be wrong, so it may just be an issue with IDLE. If it does not work when you use it, that is unfortunate, but it is supposed to. As of submission, I have to assume that it is a problem with IDLE, therefore I cannot fix it.

Screenshot/s of Test Data:

- Initial display:
 - -

- User clicks “display” on cotton beanie:

- Item added to order list, total tallied:
